Application description

HessenChemie's building in Wiesbaden is characterized by a clear and modern architectural language that is strongly supported by the U-shaped facade design: with round building corners, a roof terrace with a running sky arch and the curved entrance roof on the ground floor. The facade shows all design variants that are possible with PLEXIGLAS® Mineral: for example, large facade sheets that curve round the building or homogeneous, smooth round joints around the windows or in the transition area between the tiled and plastered facade. The homogenous, seamless surface of the PLEXIGLAS® Mineral facade sheets, which were given a matte satin finish, is highly dirt repellent. What's more, together with the invisible fastenings and the white joints, they translate the desired architectural language perfectly into reality. Together with the unique design freedom of PLEXIGLAS® Mineral, they perfect the overall picture of an outstanding facade design.
